

Marine Metre Squared

**Citizen Scientists wanted
to monitor the New Zealand seashore**

Participate and contribute to the Mm2 project by monitoring a 1m x 1m square patch of your local shore once every season. All you need to do is count the animals and plants you find and record them on a data sheet that can be uploaded to our website.

This is the perfect project for families looking for a holiday activity or schools and community groups looking for ways to engage with and improve their local environment.

By joining Mm2 you will find out more about shore life, collect valuable scientific information about the distribution and abundance of seashore animals and plants, investigate what changes occur over time and compare with other regions. It'll make you think – and ask questions!

Mm2 has been developed by the NZ Marine Studies Centre, Department of Marine Science, University of Otago and is supported by the Ministry for the Environment – Community Environment Fund.
