

Applying GAS Genomics in Public Health

Mark Davies (PhD)

Doherty Institute, The University of
Melbourne, Australia

mark.davies1@unimelb.edu.au

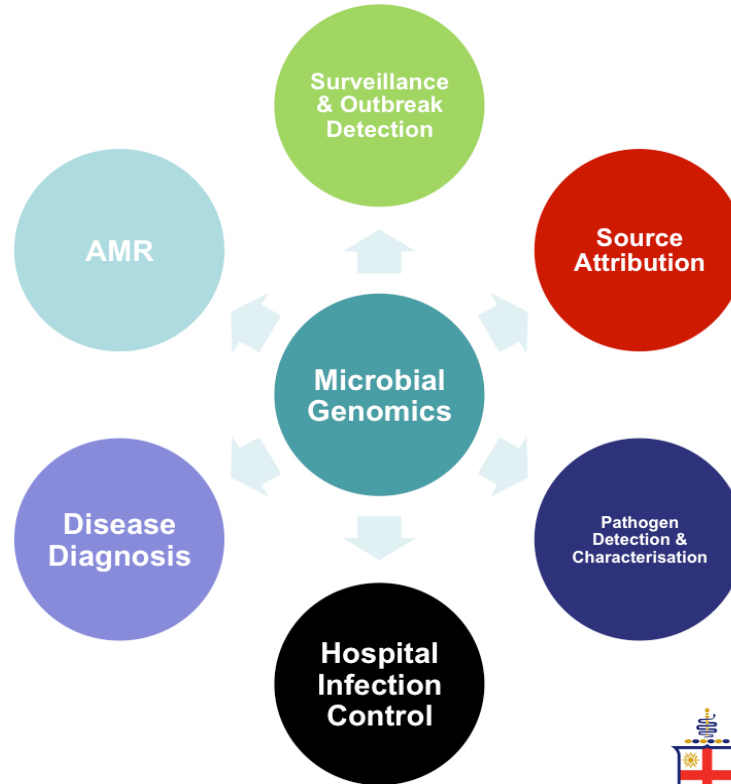

12th February 2019

11 FEBRUARY - 1 MARCH 2019
**23rd PUBLIC HEALTH
SUMMER SCHOOL**

otago.ac.nz/uowsummerschool

Applications of WGS in Clinical Microbiology

The All in One Assay

Traditional Techniques

Whole Genome Sequencing (WGS)

Pathogen Genomic Epidemiology

Linking genomics with epidemiology

Whole genome sequencing of single isolates

Assembled reference genome

Gene content
Genome organization

Comparative genomic studies with multiple isolates

Phylogenetic Tree

Pangenome Analysis

Effective
Population Size

Transmission
Mapping

Recombination
Hotspots

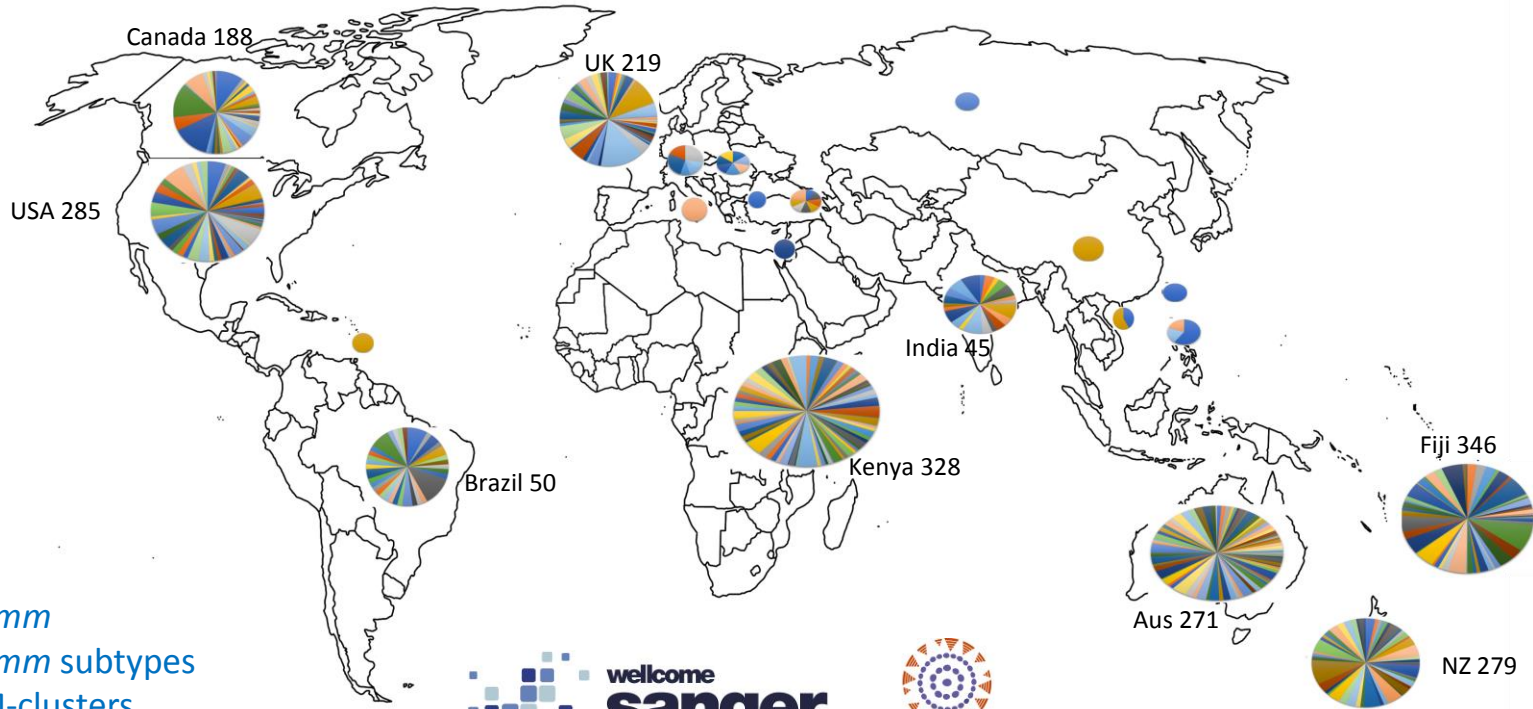

Genome-wide
Association Studies

'Global' GAS Population Genomics

Global database of 2,083 GAS genome sequences

150 *emm*
247 *emm* subtypes
37* M-clusters
484 MLST

'Global' GAS Population Genomics

~300 evolving lineages

Gene Content of GAS in Constant Flux

Unique Protein Count

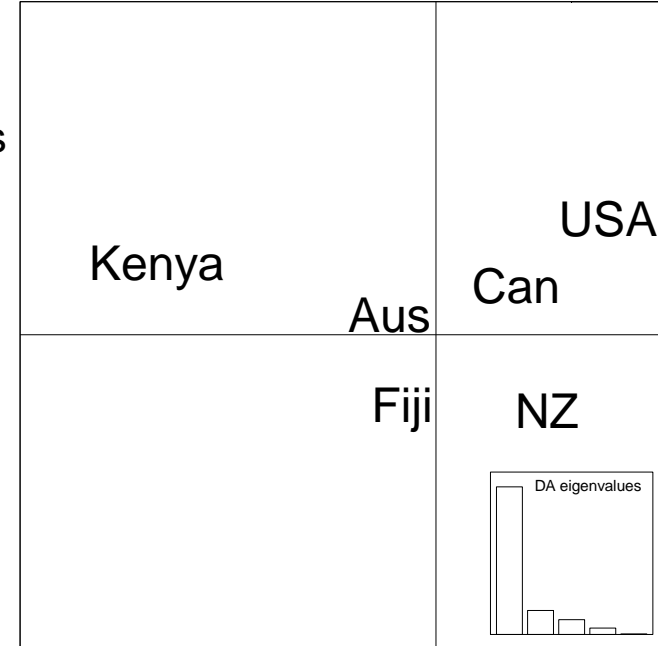

'Global' GAS Population Genomics

Extensive sequence variation in genomes exhibiting the same *emm* type

> Caution when using *emm* as a marker of 'relatedness'

Accessory Genome as a Geographical Marker

Disease is Not Evolutionary Restricted

No Single Rheumatogenic Lineage

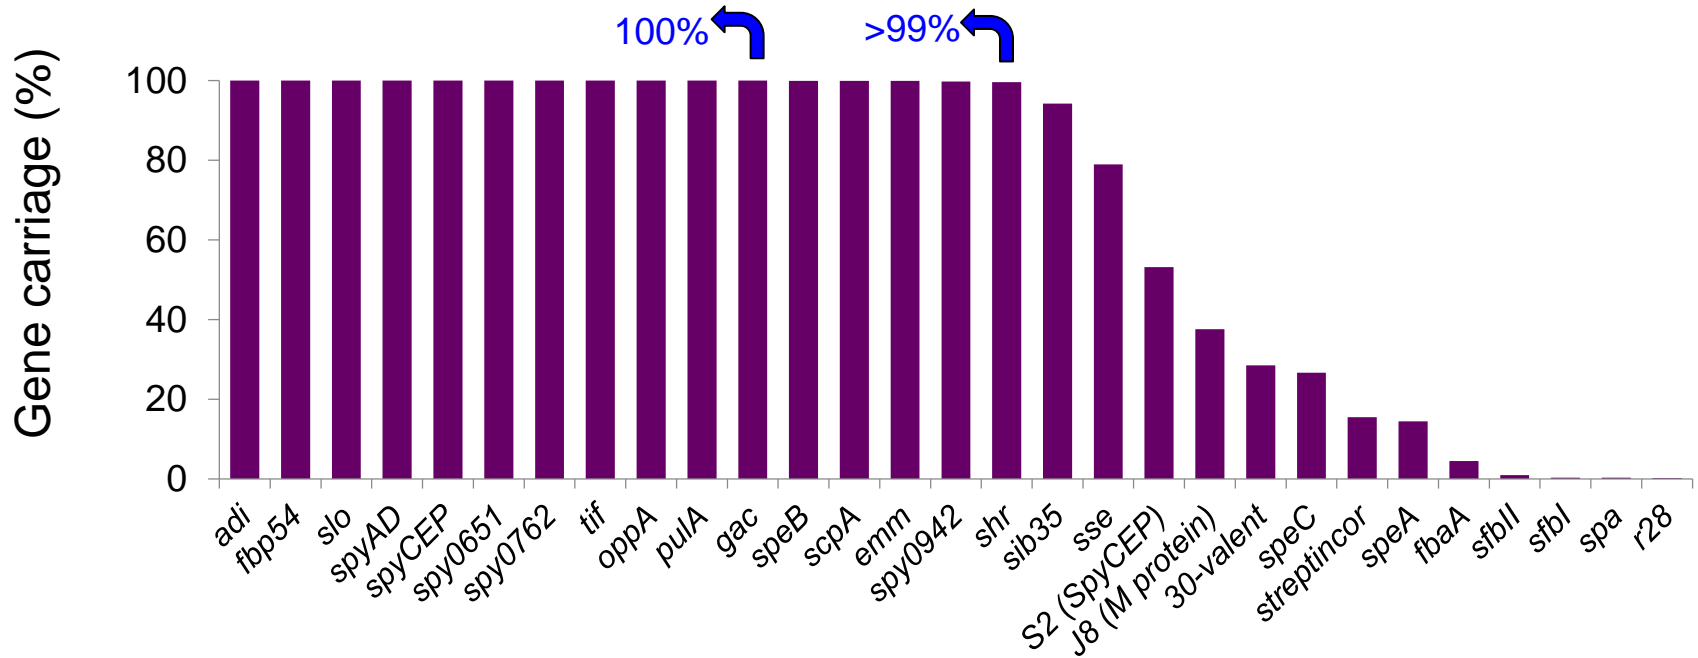

Searching for Global Disease Signatures

Advancing Vaccine Design Through Population Genomics

- Extensive genotypic and serotypic diversity (e.g. >200 *emm* types)
- Vaccine safety concerns due to the autoimmune disease caused by repeated GAS infection
- Antigen gene carriage is not universal
- Extensive antigenic variation also reported

Global Vaccine Antigen Carriage

Only 16 candidate vaccine antigens provide >99% global coverage

Global Multicomponent Vaccine Formulation

Vaccine	Vaccine antigens	Europe	Oceania	North America	South America	Asia	East Africa	TOTAL
GSK (3-valent)	SLO; SpyCEP; SpyAD	>99%	>99%	>99%	>99%	>99%	>99%	>99%
Spy7 (7-valent)	Spy0651; Spy0762; Spy0942; Pula; OppA; SpyAD; ScpA	>99%	>99%	>99%	>99%	>99%	>99%	>99%
Combo #5 (5-valent)	TF; ScpA; SpyCEP; ADI; SLO	>99%	>99%	>99%	>99%	>99%	>99%	>99%
StreptInCor	M-protein epitope	39%	26%	15%	12%	34%	17%	23%
MJ8VAX	J8 (M-protein) - DT	45%	41%	31%	31%	57%	25%	37%
S2-J8	S2 (SpyCEP); J8	>99%	>99%	>99%	>99%	>99%	>99%	>99%
30-valent	30 M-protein	71%	33%	75%	53%	73%	28%	48%
30-valent with Mrp	30 M-protein with Mrp	77%	51%	83%	59%	83%	33%	60%

Summary

- Genomics is a key technology in current/future public health
 - Diagnostics
 - Surveillance
 - Vaccine design
 - Identify molecular markers of disease
- The ability to maximise the utility of genomics relies on comprehensive sampling and routine surveillance
- Bacterial evolution is dynamic and an ongoing process
