Aim:
To establish and maintain high quality surveillance of acute flaccid paralysis (AFP) in New Zealand to demonstrate the absence of wild polio virus. This is necessary so that New Zealand can be regarded by the World Health Organization as polio free.

Objectives:
To determine:
1. The incidence of acute flaccid paralysis (AFP) in children in New Zealand.
2. Whether any cases of AFP in New Zealand are caused by polio.

**Case definition:**
Any child less than 15 years old with acute onset of flaccid paralysis in one or more limbs or acute onset of bulbar paralysis.

Background:
There are many causes of AFP including trauma, the Guillain-Barre syndrome, transverse myelitis, and poliomyelitis. It is important for registration of New Zealand as free from wild polio that all cases of AFP are investigated for polio virus infection and reported to the NZPSU, even when the clinician is convinced that polio is not the cause. The adequacy of the surveillance system will be judged by WHO on the number and distribution of incident cases of AFP reported, and the proportion appropriately investigated for polio.

All cases of AFP must have a full clinical, epidemiological and virological investigation, including the collection and analysis of 2 adequate stool samples, and a clinical follow up 60 days after the onset of paralysis. Adequate stool samples are considered to be 2 specimens collected at least 24 hours apart, taken within 14 days of the onset of the paralysis, arriving at the laboratory with proper documentation, with ice or cold packs present, and in sufficient quantity for laboratory analysis.

The final classification of cases of AFP is:
1. Poliomyelitis: A case of AFP with wild polio virus isolated.
2. Non-polio AFP: A case of AFP with adequate stool samples testing negative, or with no residual paralysis (unless wild polio virus isolated).
3. Polio-compatible: A case of AFP with residual paralysis, died or lost to follow up, and for whom stool specimens were either not taken, or were inadequate.
Reporting instructions:

*Telephone and Card reporting is required for AFP*

To streamline the process of investigation for polio virus we require all cases of AFP be notified immediately by telephone and subsequently on the report card. This should be done by telephone to the NZPSU (03 474 - 7825) as soon as possible after the diagnosis is made. If this is out of hours, or the phone is unattended, please leave a message and your call will be returned as soon as possible.

On receipt of a notification NZPSU will inform Dr Sue Huang at the Virus Laboratory of ESR and send out WHO approved packaging for the return of samples.

A short questionnaire requesting clinical details will be sent to all reporting clinicians, followed by another seeking information 60 days after the onset of paralysis.

**Investigator:**
Associate Professor Nigel Dickson, Epidemiologist,
New Zealand Paediatric Surveillance Unit
Dunedin School of Medicine, P.O. Box 913, Dunedin
Tel: 03 479 -7211
Fax: 03 474 -7817
Email: nzpsu@otago.ac.nz

**Thank you for your help and support**

*The results of this surveillance will be included in the Annual Report of the NZPSU which will be distributed at the Paediatric Society’s Annual Scientific Meeting (or can be requested directly from NZPSU)*
