

# How did that get built?

Employing analytical governance frameworks to understand urban design

*Colin O'Byrne, School of Surveying*

Relationships between the process and products of urban design have been analysed and articulated using conceptual frameworks that emphasize different perspectives. This presentation summarises these and compares them with analytical frameworks used in the field of urban governance studies. While there is a reasonable amount of overlap between these areas, frameworks employed in urban governance analysis can offer more comprehensive insights into the forces and practices that combine to shape the built form. These tools are useful for understanding why places look the way they do and for envisioning future design and development processes.
